The Autodesk AutoCAD software suite includes the software programs AutoCAD LT, AutoCAD R14, AutoCAD LT 2017, AutoCAD Architect, and AutoCAD Mechanical. AutoCAD LT and AutoCAD Architect are designed for 2D drafting and basic 3D modeling, and provide the user with a simplified user interface and an ease-of-use philosophy. AutoCAD R14, AutoCAD LT 2017, and AutoCAD Architect are primarily for production-based use by architects and engineers. AutoCAD LT and AutoCAD R14 are equipped with a set of tools to assist with creating architectural elements. Like all applications in the Autodesk product portfolio, the Autodesk AutoCAD suite is a solution for planning, creating, and publishing. In the solution, AutoCAD is used to create 2D and 3D drawings and to publish them to other applications and websites, whether via AutoCAD's native software, a web browser, or a desktop or mobile app. The Autodesk AutoCAD 2019 release was announced on June 26, 2018. In the press release, Autodesk stated that "in a CAD update, the team is adding new features to help users work more efficiently and improve the overall user experience. In addition, to help users choose the right software, the team is announcing the new AutoCAD LT 2017. In this release, AutoCAD LT features a more visual workflow and is bundled with AutoCAD MEP. This new user experience is complemented with the new AutoCAD Architect." Overview In May 2018, Autodesk announced the Autodesk AutoCAD 2019 release that added a number of new features and improvements to AutoCAD and its associated products, including a mobile version of AutoCAD, AutoCAD Architect, and AutoCAD MEP. The 2019 release consists of the following major changes to AutoCAD LT: A version of AutoCAD MEP has been integrated into AutoCAD LT; the product formerly known as MEP and ACIS was renamed AutoCAD MEP and is now a separate program, available for standalone use on Windows, macOS, and Linux. The software has been split into three groups: AutoCAD LT, AutoCAD LT 2017, and AutoCAD LT 2019. AutoCAD LT is a basic 2D CAD package that is suitable for users who mainly draft, label, and annotate. BEIRUT (Reuters) - An Israeli strike killed three people and wounded more than a dozen, mostly women and children, in a strike in the northern Syrian village of Binnish, the Syrian Observatory for Human Rights said on Wednesday. The strike hit an area in the center of the village, the observatory said, citing local sources. There was no immediate comment from Israel or Syrian authorities. The Britain-based Observatory, which tracks the violence in Syria, said the people killed were all civilians, and the wounded included women and children. Syria's civil war, which began in 2011, has killed nearly half a million people and driven around 10 million from their homes. Israel rarely confirms or denies its involvement in the fighting, but Israeli officials say it views Iran's intervention on the side of President Bashar al-Assad as a threat to its security. Iran has backed Assad during the civil war, and Israel has vowed to prevent its arch enemy from establishing a military foothold on its borders. Israel and Iran back opposing sides in the conflict, but they have taken a hard line against a U.S.-led alliance of Gulf Arab states that are seeking to topple Assad. Israel and Iran are believed to have carried out dozens of air strikes on Syrian arms depots and weapons convoys belonging to the Syrian army and its allies over the past two years. Israel has also struck Iranian-backed fighters and allies belonging to Islamic State inside Syria, where a U.S.-led coalition is waging its own air campaign against the group. Israel often says its forces only target military targets in Syria. Electrochemical oxidation of carbon nanotubes bundles and nanotube forests as active electrode materials. We demonstrate that commercially available carbon nanotubes bundles (CNTBs) and bundles made from multiple aligned nanotubes (multi-aligned CNTBs) can be readily oxidized electrochemically in basic solution (electrochemical oxidation, EO). Compared to pristine CNTBs and the most commonly used CNTBs (unaligned CNTBs), EO-treated CNTBs exhibit not only higher surface area but also better conductivity. For
